Dear Reader,

They say that good design requires no thought; that it should flow seamlessly in one's life. I apply that same philosophy to technology and take that same approach when coding.

As a former architect and an avid lover of art, I appreciate the parallels between the principles of design and the principles of coding. The synthesis of structure and the freedom of creativity; the contemporary, yet recursive nature of innovation. These are what moved me to pursue a career in technology, and still what moves me every time I code.

My name is Kevin and I am a Software Engineer from Seattle.

Originally from the San Francisco Bay Area, I began my education at the University of San Francisco's School of Architecture. Not long after, I realized that architecture was not my calling. Fortunately, in that time, I discovered my passion for style and design.

With advice from friends (particularly those who worked as Software Engineers and Developers), I would later pursue these passions down a new path: the Tech Industry.

Initially majoring in Computer Information Systems, it would be another few years until I realized how diverse a field Tech was, and that I was still yet pursuing my exact calling. However, this time was not in vain. If my time in Architecture helped me discover my passion for fine arts, then my time in CIS helped me discover my passion for data and structure.

Since my transition into Software Engineering earlier this year, I have felt a sense of accomplishment and fulfillment that every person should have the privilege of experiencing.

Though my background might seem eccentric, my eclectic history has helped me gain a comprehensive understanding of the Tech Industry. I understand the importance of technology and its impact on our lives. The ubiquity of these tools makes information and design accessible.

Like good art, technology enriches our lives; it has the ability to empower and move the individual. And with the right company, I believe we can accomplish just that.

Looking forward to connecting with you.

All the Best,

Kevin
